Cisco I-Intro to Networks
Week3 Lab 1
Connecting and Configuring a Small Network

Step 1: Select the correct patch leads (cables).

- ***Use Copper Straight-Through cables for connecting:***
 - *PC ↔ Switch*
 - *Switch ↔ Router (modern routers/switches usually support auto-MDI/MDIX, but straight-through is standard).*

Connecting and Configuring a Small Network

- Use **Crossover cables** only if connecting **similar devices** without auto-MDI/MDIX support (e.g., Switch ↔ Switch, Router ↔ Router, or PC ↔ PC).

Step 2: Connect the devices.

1. Connect PC1's FastEthernet0 to Switch Port FastEthernet0/1 with a **straight-through cable**.
2. Connect PC2's FastEthernet0 to Switch Port FastEthernet0/2 with a **straight-through cable**.
3. If a router is included, connect the Router GigabitEthernet0/0 to Switch Port FastEthernet0/24 with a **straight-through cable**.

Step 3: Assign IP addresses to hosts.

- On PC1:
 - IP Address: 192.168.1.2
 - Subnet Mask: 255.255.255.0
 - Default Gateway: 192.168.1.1
- On PC2:
 - IP Address: 192.168.1.3
 - Subnet Mask: 255.255.255.0
 - Default Gateway: 192.168.1.1
- On Router (if used):
 - GigabitEthernet0/0: IP Address: 192.168.1.1
 - Subnet Mask: 255.255.255.0

Step 4: Verify connectivity with ping.
