

For my Service Learning Project, I have chosen to look to find work with a **local nonprofit community center** that provides educational resources and outreach programs for families. An organization that will rely on technology for scheduling events, managing volunteers, and storing participant information. Because they serve a broad audience including children and senior citizens they face unique risks when it comes to phishing emails, weak passwords, and accidental data leaks.

Security awareness is especially important for this nonprofit because they operate with limited funding and cannot afford dedicated IT security staff. A successful attack could disrupt their programs, expose private information, and reduce the trust of the community they serve. My role in this project will be to create **tailored training materials** that focus on practical, everyday security habits such as identifying phishing attempts, creating strong passwords, and practicing safe browsing. I will use real-life examples relevant to their context so the training feels accessible and applicable.

By applying cybersecurity awareness to a nonprofit organization, I hope to build both their resilience and my own skills as a future Security Awareness Officer.
